## Security Threats Big and Small

### Continued from page 1

13. Know the signs of a dying computer. A blue screen can mean a hardware problem or driver conflict. If things are taking way too long, there may be too much software or a failing hard drive. Strange noises during startup, for instance, can also mean a hardware failure. Consider it your warning.
14. Set up your backups. You can set up backup protocols with a program like Belarc Advisor, which is free and lets you know what to install and when it's time to replace a computer.
15. Consider replacing your computer every two or three years to avoid being stiffed by a computer that's suddenly gone stiff. Nothing's more alarming than suddenly losing all your data, and there's no backup computer that you can just turn on and pick up where you left off.

Robert Siciliano, CEO of IDTheftSecurity.com, is committed to informing, educating and empowering Americans so they can be protected from violence and crime in the physical and virtual worlds.
